

HOOK Generator

Hook Generator export all or some of the hooks of the on air database.

The real time connection to the on air database scan every time intervall if new hooks are build, and export them to a specific folder.

Each hook will be build with a description XML files containing all information for an internet provider.

The exported hook file format can be defined.

Together with the hook file some liner /station id can be add in the beginning and the end of the hook.

So that the generated hook is part of some radio station id.

The category and/or the name of the hook can be chosen so that not the all hooks of database are exported.

XML export format can be defined in a template so that each Radio station is able to define the needed RSS or XML file.
